PROJECT DESCRIPTION:
The project is a green field project located in the north-eastern part of Nampula Province in Northern Mozambique. It involves dredge mining of titanium bearing sands, the production of Heavy Concentrate (HC) in a floating concentrator plant and the separation of final products in a dry separation plant.

PROJECT BENEFITS:
The project included the development of roads, power, water supply, a clinic, a school, airstrips and other services to improve the living standard of the population in the project area. The project has also generated employment within the project area.
In fact, through the Kenmare Moma Development Association (KMAD), the project has empowered local communities to participate in the procurement value chain of the mine, thereby improving the lives of the local inhabitants.
In 2009, KMAD won the President’s Award for the best International CSR Programme from the Chambers of Commerce of Ireland and Nedbank Capital Green Mining Award for its activities aimed at social and economic enhancement of the communities surrounding Kenmare’s Titanium Minerals Mine in northern Mozambique.
The project is currently being expanded to double its capacity and extend the mine life.
